Manual of the Eysenck Personality Inventory. Personality Questionnaire. Form A(B.).-Hans Jurgen Eysenck 1964

Manual of the Eysenck Personality Questionnaire (junior and Adult)-Hans Jurgen Eysenck 1975

Dimensions of Personality- Martin Rein 2018-02-06 This is the original work on which Hans Eysenck's fifty years of
research have been built. It introduced many new ideas about the nature and measurement of personality into the field, related personality to abnormal psychology, and demonstrated the possibility of testing personality theory experimentally. The book is the result of a concentrated and cooperative effort to discover the main dimensions of personality, and to define them operationally, that is, by means of strictly experimental, quantitative procedures. More than three dozen separate researches were carried out on some 10,000 normal and neurotic subjects by a research team of psychologists and psychiatrists. A special feature of this work is the close collaboration between psychologists and psychiatrists. Eysenck believes that the exploration of personality would have reached an advanced state much earlier had such a collaboration been the rule rather than the exception in studies of this kind. Both disciplines benefit by working together on the many problems they have in common. In his new introduction, Eysenck discusses the difficulty he had in conveying this belief to scientists from opposite ends of the psychology spectrum when he first began work on this book. He goes on to explain the basis from which Dimensions of Personality developed. Central to any concept of personality, he states, must be hierarchies of traits organized into a dimensional system. The two major dimensions he posited, neuroticism and extraversion, were in disfavor with most scientists of personality at the time. Now they form part of practically all descriptions of personality. Dimensions of Personality is a landmark study and should be read by both students and professionals in the fields of psychiatry, psychology, and sociology.

**The Dynamics of Anxiety and Hysteria-Hans Eysenck 2018-04-27** Here Hans Eysenck applies the principles of modern learning theory to account for the observed phenomena of hysteria and anxiety. Such principles were initially developed through the experiments and theories of Pavlov, Hull, and Tolman. When The Dynamics of Anxiety and Hysteria initially appeared, these were considered the most advanced, relevant, and applicable to the subject matter. They have not been superseded by later work. The Dynamics of Anxiety and Hysteria has never been published in the United States. It was the fifth book Eysenck authored as part of a series of experimental studies and theoretical work carried out under the auspices of the Institute of Psychiatry at the University of London. Two of the first four books-Dimensions of Personality and The Psychology of Politics, have been reissued with new introductions. These focus on dimensional analysis of personality based on experimental and empirical studies. The present work, on the other hand, goes beyond classification to a study of dynamics; from nosology to aetiology; from description to causation. Eysenck scientifically explores such topics as learning theory and
human behavior, personality and learning theory; personality and perceptual processes, socialization and personality, drugs and personality, and psychological theory and psychiatric practice. This volume, which complements Transaction's other new editions of Eysenck's groundbreaking work, will be of lasting significance to psychologists, psychiatrists, behavioralists, and students of personality disorders. He provided for modern psychology the empirical foundations of themes that previously were the monopoly of psychoanalysis. Hans J. Eysenck (1916-1997), a professor of psychology at the University of London and the director of its psychological department at the Institute of Psychiatry, was best known for his experimental researches in the field of personality. He was a prolific author and wrote, among others, Rebel with a Cause, Dimensions of Personality, and Intelligence, all available from Transaction.

EXPERIMENTS IN PERSONALITY-Hans Jurgen Eysenck 1960

A Model for Personality-H.J. Eysenck 2012-12-06 H. J. Eysenck This book is not an introduction to personality research, it is not a textbook,
and above all it is not a model of personality. The title, A Model for Personality, was chosen on purpose to indicate that we are here concerned with a discussion of how models in this field ought to be constructed, what their functions were, and whether such models or paradigms could with advantage be produced at this stage of development. One particular aspect of personality, extraversion introversion (E), has been chosen to exemplify the desiderata which emerge from such a discussion. It is not suggested that personality and E are synonymous - merely that this particular dimension is perhaps better known than any other, has had more experimental work done on it than any other and has acquired a better theoretical substructure, and more links with genetics and physiology, than any other. Hence it seems most likely to serve as an example of how a satisfactory model of personality might ultimately be constructed, i.e. by analogy with E. Other dimensions of personality, such as neuroticism-stability or psycho ism-superego functioning, are mentioned in the discussion, but only when they overlap or interrelate with E. The book uses E as an example to illustrate the way in which a model of personality can be constructed, but it is in no way a summary of all that is known about E.

New Psychological Tests and Testing Research-Lydia S. Boyar 2007 Psychological testing has grown exponentially as technological advances have permitted it to and societal complexities have necessitated its growth. Psychological testing or psychological assessment is a field characterised by the use of samples of behaviour in order to infer generalisations about a given individual. By samples of behaviour, one means observations over time of an individual performing tasks that have usually been prescribed beforehand. These responses are often compiled into statistical tables that allow the evaluator to compare the behaviour of the individual being tested to the responses of a norm group. The broad categories of psychological evaluation tests include: Norm-referenced, IQ/achievement tests, Neuropsychological tests, Personality tests, Objective tests (Rating scale), Direct observation tests, Psychological evaluations using data mining. New and important research is presented in this book.

Measures of Personality and Social Psychological Constructs-Gregory J. Boyle 2014-09-04 Measures of Personality and Social Psychological Constructs assists researchers and practitioners by identifying and reviewing the best scales/measure for a variety of constructs. Each chapter discusses test validity, reliability, and utility. Authors have focused on the most often used and cited scales/measure, with a particular emphasis on those published in recent years. Each scale is identified and described, the sample on which it was developed is summarized, and reliability and validity data are presented, followed by presentation of the scale, in full or in part, where such permission has been obtained. Measures fall into five broad groups. The emotional disposition section reviews measures of general affective tendencies, and/or cognitive dispositions closely linked to emotion. These measures include hope and optimism, anger and hostility, life satisfaction, self-esteem,
confidence, and affect dimensions. Emotion regulation scales go beyond general dispositions to measure factors that may contribute to understanding and managing emotions. These measures include alexithymia, empathy, resiliency, coping, sensation seeking, and ability and trait emotional intelligence. The interpersonal styles section introduces some traditional social–psychological themes in the context of personality assessment. These measures include adult attachment, concerns with public image and social evaluation, and forgiveness. The vices and virtues section reflects adherence to moral standards as an individual characteristic shaped by sociocultural influences and personality. These measures include values and moral personality, religiosity, dark personalities (Machiavellianism, narcissism, and subclinical psychopathy), and perfectionism. The sociocultural interaction and conflict section addresses relationships between different groups and associated attitudes. These measures include cross-cultural values, personality and beliefs, intergroup contact, stereotyping and prejudice, attitudes towards sexual orientation, and personality across cultures. Encompasses 25 different areas of psychology research Each scale has validity, reliability info, info on test bias, etc Multiple scales discussed for each construct Discussion of which scales are appropriate in which circumstances and to what populations Examples of scales included

The Oxford Handbook of Exercise Psychology
Edmund O. Acevedo
2012-04-13

Awareness of the importance of exercise and physical activity to optimal physical and mental health has never been greater. It is widely acknowledged that physical inactivity is a leading cause of death, yet statistics show less than 50% of Americans participate in regular physical activity. This information highlights the public health challenge of increasing participation in physical activity to enhance physical health and to buoy the psychological benefits associated with physical activity. The Oxford Handbook of Exercise and Psychology is an authoritative and comprehensive presentation of the breadth and depth of empirical contributions utilizing state-of-the-science theories and approaches in exercise psychology. Chapters are authored by leading investigators across the globe who have made significant scientific contributions addressing the behavioral aspects of physical activity. Sections of the book address the effects of physical activity on mental health; knowledge gathered utilizing psychobiological perspectives; behavioral factors that impact exercise motivation; scientific contributions addressing the physical activity benefits with special populations, including individuals with physical disabilities, older adults and cancer patients; and promising areas for additional investigation. Each chapter presents a summary of scientific advancements in the topic area as a foundation for future investigation. Fueled by a broad range of disciplines and interdisciplinary approaches, the field of exercise psychology is growing, and this comprehensive handbook...

The Creativity Research Handbook - Mark A. Runco
1997 For years the research on creativity has been divided into person, process, product and press (environment) foci. However, the field is now much more extensive and diverse than it was when this scheme was proposed, and these four categories no longer capture its essence. ""The Creativity Research Handbook"" shows how extensive and diverse the field has become. ""The Handbook"" contains extensive reviews and is intended to provide a comprehensive review of creativity research, first by the breadth of coverage of the chapters and second, by the depth and coverage within each chapter. ""The Handbook"" is divided into two parts, the first disciplinary and the second topical. The approach is a comprehensive one - authors do not focus on their own models or theories but instead...
give complete overviews. The disciplinary structure allows a more sensitive and accurate placement of research. The disciplinary framework also facilitates exchanges with the wider scholarly community - research on creative thinking, for example, shares assumptions with the cognitive sciences, and the disciplinary assignment can help individuals studying creativity to benefit from those sciences. Several of the contributions demonstrate how creativity research has benefited from such disciplinary connections. Part 2 contains six topical chapters; each of them focuses on one critical topic.

Personality Structure and Measurement (Psychology Revivals)-Hans J. Eysenck
2013-11-26 Originally published in 1969, this book deals extensively with the description and measurement of personality. Beginning with a statement of the principles of typological research in psychology, set against the background of general taxonomic principles in biology, the study discusses in detail results and generalisations from the Eysenck's previous work. The second part of the book describes several large-scale studies using personality questionnaires prepared by the authors, as well as the standard ones of Cattell and Guilford. There is a comparative study of the Eysenck, Cattell and Guilford inventories, which analyses the degree to which similar factors can be found in these three instruments and discusses areas of agreement and disagreement between the three authors. The third part deals with personality studies in children, and includes a chapter on personality structure in subnormal subjects. These studies are concerned with discovering the extent to which personality structure changes with increasing age, and to what extent it is possible to measure personality in younger children. They also examine sex differences in personality structure, and show quite marked differences between the sexes on a number of primary personality traits. The results of the Eysenck's work in this field directed new light on the structure of personality and cast doubt on many widely accepted findings of the time.
